The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta sequence-specific amplification of the rpoB gene (encoding the beta sequence-specific amplification of the rpoB gene (encoding the beta sequence-specific amplification of the rpoB gene (encoding the beta sequence-specific amplification of the rpoB gene (encoding the beta sequence-specific amplification of the rpoB gene fragment, that is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S TRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species

This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterials species provides an efficient way of characterising these species. In addition to the 16s rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                               New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the probe kato, rpsL/s12 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as tantibiotic treatment options.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 1998-539367/46
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     E X

                     phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                     This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to
                                                                                                                                                                                                                            New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The antibiotic resistance spectrum (ARS) of a mycobacterium can be determined by amplifying the relevant part of the antibiotic resistance gene, i.e. the M. tuberculosis rpoB gene fragment amplified using the primer set AAT12091-98, hybridising it with a least 1 rpoB gene probe, detecting the hybrids formed and inferring the ARS, and opt. the spp., from the differential hybridisation patterns. The method is partic. useful for the detection of rifamplein and/or rifabutin resistance in M. leprae or M. tuberculosis, and mycobacterial spp. identification. The method is rapid and reliable and provides simultaneous determn.
        The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene amplification primer rpoB-F (bp 2201-2220). It is used with the reverse primer given in AAA49826 for the advection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA4983). Amplification and cycle sequencing primers (see AAA4982-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined analysis of antibiotic resistance-associated mutations in defined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 22; Page 39;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (streptomy(in), and (streptomy(in)), pncA (pyrazinamide), gyrA (ciprofloxacin) and 23S (azithromy(in)) genes of M. tuberculosis. These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. without prior amplification, to detect the rposence of mind 23S genes for the present to evaluate the rpose, kato, rpsi/sl2 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis, and is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as tests are rapid, sensitive and accurate providing information as
                                           The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene sequencing primer rpoB-5s (bp 2201-2220). It is used with the reverse primer given in AAA49826 and with the amplification primers given in AAA49823 and AAA49824 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), kat6 (isoniazid), cxyr-aphC PR
                                                                                                                                                                                                                                                                                                   WPI; 2000-431611/37.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Two primers (AAR79122, AAR79123) were used to amplify a 620 region of the Mycobacterium tuberculosis rpoB gene, which, when mutated is associated with rifampin resistance. The 620 bp region amplified spans both the H451Y and S456L mutations. The amplified fragments are given in AAR729124 (Wild type) and AAR729125-26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        JT 8

                                                                                       This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The 1st several bases comprise nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. tuberculosis and the concurrent determination of its drug susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.

                                                                                                                                                                                                                                                                              method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of
                                                                                                                       1529
                                                                                                                                                                                                                                                                                                                                                              polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polypucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The

                                                                                                                                                                                  The present invention describes a method for generating a repertory of CC nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic cc acids of determined algal, archaeal, bacterial, fungal and parasitteal cspecies with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more cc used for producing probes and/or primers for detecting one or more cc used for producing probes and/or primers for detecting one or more cc used for producing probes and/or primers for detecting one or more cc used for producing probes and/or primers for detecting one or more cc detection and identification of an algal archaeal, bacterial, fungal and contained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the contained using the method of the invention can be used for the universal contained contained using the method of the invention can be used for the universal contained using the method of the invention can be used for the universal contained using the method of the invention can be used for the contained contained contained using the method of the invention of any bacterian of a therapeutic agent which is effective against the cross of the specific and contained using the method of the treptococcus phylum or group contained the detected include Abiotrophia adiacens, Bordetella sp., cc which can be detected include Abiotrophia adiacens, Bordetella sp., cc which accounts and coli, provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. Ca which are given in the exemplification of the present invention.
                                                                              Matches
                                                                                                  Query Match

Alfampin resistance is largely associated with point mutations localised in a small core region of 81 base pairs in the rpoB gene, which encodes the RNA polymerase beta subunit. To detect a mutation, a complex is formed comprising a first sequence representing the predetermined region of the gene of the organism and a second sequence representing the corresponding region of the gene of the wild type organism in double stranded form. Each member of at least one pair of non-complementary strands within the complex has a label. The association of the labels in the complex is related to the presence of the mutation. The presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2122

The method comprises detecting the presence of a least 1 mutation in a first sequence and relating the presence of the mutation to drug resistance. Included in the invention are a kit for carrying out the method and a method for detecting the presence of a difference between two related nucleic acid sequences in an organism. The methods are useful for detecting resistance to drugs such rifampin and pyrazinamide in Mycobacterium. The present sequence represents the Mycobacterium tuberculosis rpoB gene (which encodes the RNA polymerase beta subunit). The sequence is used in an example of the method of the invention for the detection of rifampin resistance in M. tuberculosis.

The method is partic. useful for the detection of rifampicin and/or rifabutin resistance in M. leprae or M. tuberculosis, and mycobacterial spp. identification. The method is rapid and reliable and provides simultaneous determn.
This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The method provides for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probes and primers for determn. of antibiotic resistance spectrum of Mycobacterium, opt. coupled with species identification – from different patterns of hybridisation with rpoB gene

PCR amplification was used to obtain rpoB genes from rifampicin-resistant Mycobacterium leprae strains. A comparison with the sequence of the rpoB gene from sensitive strains (AQAG5132) revealed mutations in the region encoding amino acids 400-450. A common
                                                        Rapid detection of antibiotic resistance in Mycobacteria isoniazid, rifampicin or streptomycin resistance in tubes by detecting mutation in katG, rpoB or rpsL genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      detection of M. tuberculosis and the concurrent determination of
drug susceptibility, particularly to rifamycin. The method can
provide often greater than 95% sensitivity and 100% specificity.
The biological sample is a fluid or tissue sample from a human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sacchi, N. Anal. Biochem. 162, 156-159, 1987). Poly (A)+ RNA was purified by oligo dT column and cDNA was synthesized as described previously (Adams, M. D. et al. Nature Genet. 4, 373-389, 1993). cDNA was ligated to a two fold molar excess of a NotI/HindIII digested plasmid DNA (lafmid BA vector, a phagemid derived from pEMBL, Adams, M. D. et al. Nature Genet. 4, 373-389, 1993) and electroporated into E. coli strain DH10B (BRL). The library was amplified and further selected for clones containing long inserts (>500 bp) by purification of the plasmid DNA from a fragment of a 1% low-melting-point agarose gel, containing the smear of the library and electroporation into DH10B cells. D. et al. Nature Genet. 4, 373-389, 1993)) and electroporated into E. coli strain DH10B (BRL). The library was amplified and further selected for clones containing long inserts (>500 bp) by purification of the plasmid DNA from a fragment of a 1% low-melting-point agarose gel, containing the smear of the library and electroporation into DH10B cells. Constructed at the Institute for Genomic Research (TIGR),

Rockville, MD. Genomic DNA isolated from a cloned population of

Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically shear

to give a tight size distribution (
4 kb). The v + 1 method used for the library construction is

described in detail in Smith, H. and Venter, J.C. (Making small

Insert libraries for whole genome shotgun sequencing projects.

/note="organ; pancreas; vector: pOTB7; Site_1: XhoI;
Site_2: EcoRI; cDNA made by oligo-dT priming.
Directionally cloned into EcoRI/XhoI sites using the
following 5' adaptor: GGCACGAG(G). Library constructed by
Ling Hong in the laboratory of Gerald M. Rubin (University
of California, Berkeley) using ZAP-cDNA synthesis kit
(Stratagene) and Superscript II RT (Life Technologies).
Note: this is a NIH_MGC Library."

          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score

                                                                                                                                                                                     COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/313,185
FILING DATE: 12-OCT-1994
CLASSIFICATION: 435
CCASSIFICATION: 435
SEQUENCE CHARACTERISTICS:
LENGTH: 3447 base pairs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               APPLICANT: Heym, Beate
